

## **Double-Take® Software Launches Double-Take® Availability for Linux Version 4.6**

*Adds full-server failover for Linux to provide complete workload availability; support for SUSE Linux 9 and 11*

**Worcester, UK – 1<sup>st</sup> February 2010** – [Double-Take® Software](http://www.doubletake.com) (NASDAQ:DBTK) today announced Double-Take® Availability for Linux Version 4.6, which now provides businesses with continuous full-server protection for entire workloads running on Linux systems, including operating system and application files, data and applications. This product conducts real-time, full-server replication of OS, application and data files to another server, allowing the user to effectively recover data on demand in the case of a server failure or data loss.

In addition to full-server replication, Double-Take Availability for Linux Version 4.6 also expands support for Novell® SUSE® Linux Enterprise Server (SLES) beyond version 10 to include support for versions 9 and 11. Double-Take Availability for Linux Version 4.6 is an ideal solution for continuous protection and application availability for Linux users without the expense and complexity of hardware-based replication or proprietary clustering technologies.

Double-Take Availability for Linux Version 4.6 also boasts an added management console wizard to simplify setup of full-server protection. With this release, the product also now offers network auto-tuning, supporting many different network configurations automatically and often providing customers with increased performance.

Ian Masters, UK sales and marketing director at Double-Take Software commented, *“Double-Take Software is the only software vendor that offers real-time, full-server replication for Linux workloads. While other solutions only replicate at specific times or when an operating system is down, Double-Take Availability performs this important task in real time to provide companies with first-class data protection and recovery for their Linux systems.”*
